EXAMINER'S STATEMENT OF REASONS FOR ALLOWANCE

1. Claims 1-32 are allowed over prior arts.

2. The following is an examiner's statement of reasons for allowance:

Applicant's invention is drawn to a method for scanning a configuration memory space located in an identification register whose value matches a predetermined value, i.e., known offset, in order to allow hardware designers to move pre-defined structures to different locations within the configuration space of a device.

Applicant's independent method claims 1 and 17, each recites, *inter alia*, scanning an address space to locate a structure, as defined in the specification (pages 5-8), wherein a identification register identifies a starting address location of the structure within the address space, reading a second capabilities pointer if the first identification value of the first identification register dose not matches the predetermined value, determining the starting address location of the structure from the identification register whose value matches the predetermined value, and accessing a register located within the structure by adding a predetermined offset to the starting address location of the structure. These steps, in combination of the remaining steps, are neither taught nor suggested by the prior art.

Accordingly, Applicant's claims are allowed for these reasons and for the reasons recited in the previous Amendments and Remarks.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue

fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

3. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. Betker et al. (US PAT. 5,909,557) discloses a bus interface for configuring a processor (100), allows the processor to interface with external buses of difference types, wherein the buses have different data widths, i.e., 8-bits bus transfer, or 16-bits transfer, (figure 1, and col. 3 line 19 to col. 4 line 63), which Betker neither teaches the steps of , reading a second capabilities pointer if the first identification value of the first identification register dose not matches the predetermined value, determining the starting address location of the structure from the identification register whose value matches the predetermined value, and accessing a register located within the structure by adding a predetermined offset to the starting address location of the structure.
